

Unipolar Hall Effect Switch CYD507

Applications

- Automotive brake pedal position detection
- Proximity detection
- Speed measurement
- Weak magnetic field applications
- Solid state switches etc.

Features

- 2.7V to 30V operation voltage
- Overvoltage protection capability up to 40 V
- High accuracy unipolar switch
- Built-in dynamic offset cancellation
- Open drain output
- Low thermal drift of magnetic sensing
- Qualified according to AEC-Q100 test standard

Order Information

- CYD507-PA
Package (PA): UA, LH

Package Type

P/N: CYD507-XX

TO92S (UA)

SOT23-3L (LH)

Specifications

Absolute Maximum Ratings ($T_A=25^\circ\text{C}$)

Parameter	Symbol	Conditions	Rating	Unit
Maximum supply voltage	V_{DDMAX}		30	V
Operating temperature	T_A		-40~+150	$^\circ\text{C}$
Storage temperature	T_S		-40~+165	$^\circ\text{C}$
Maximum output current	I_{OMAX}		25	mA

Electrical Characteristics ($T_A=25^\circ\text{C}$, $V_{DD}=12\text{VDC}$)

Characteristic	Symbol	Test Condition	Min.	Typ.	Max.	Unit
Supply voltage	V_{DD}		2.7		30	V
Supply current	I_{DD}	Output open		2.5	3.2	mA
Low output voltage	$V_{OL(ON)}$	@ $I_{OUT} = 20\text{mA}$		130	400	mV
Output leakage current	I_{OH}	Output switch off			0.1	μA
Output voltage	V_{OUT}				30	V
Output voltage fall time	t_f	$V_{DD}=12\text{V}$; $R_L=820\Omega$; $C_L=20\text{pF}$			1	μs
Output voltage rise time	t_r				1	μs
Delay time	t_d			18		μs

Magnetic Characteristics ($T_A=25^\circ\text{C}$, $V_{DD}=12\text{VDC}$)

Characteristic	Symbol	Test Condition	Min.	Typ.	Max.	Unit
Operating point (On point)	B_{OP}	Pullup resistor $R_L=1\text{k}\Omega$, Load capacitor $C_L=20\text{pF}$		27		mT
Release point (Off point)	B_{RP}			23		mT
Hysteresis	B_{HYS}			4		mT
Temperature coefficient	T_C			-300		ppm/ $^\circ\text{C}$

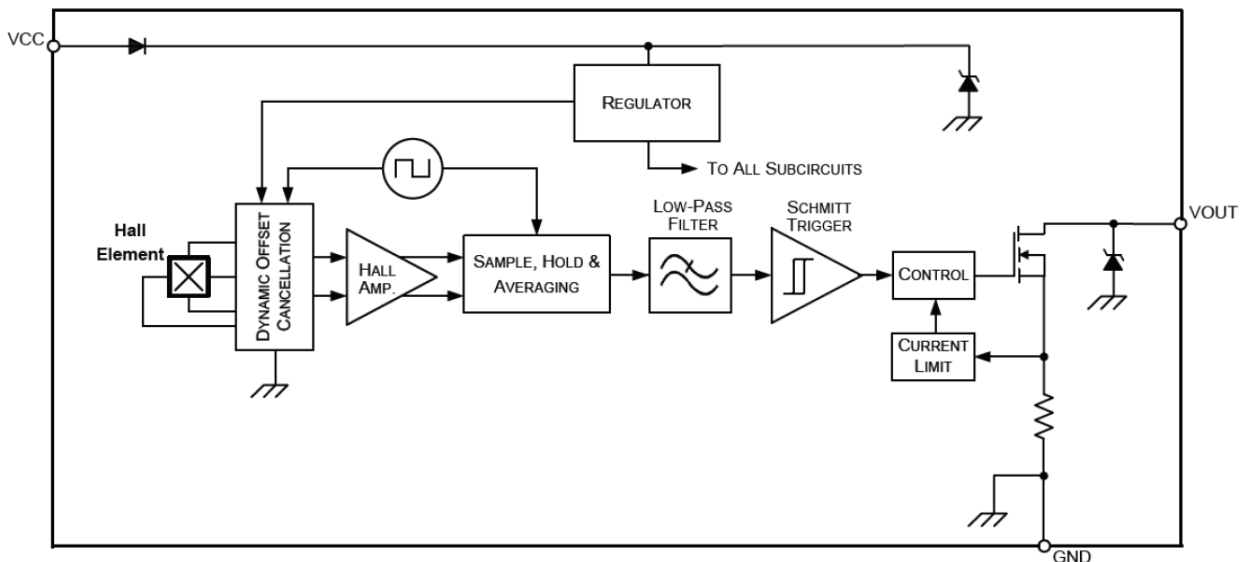

General Specifications

CYD507 Hall Effect Switch is a monolithic integrated circuit which switches in response to magnetic field. If a magnetic field with flux lines perpendicular to the sensitive area is applied to the sensor, the biased Hall plate forces a Hall voltage proportional to this field. The Hall voltage is compared with the actual threshold level in the comparator. If the magnetic field exceeds the threshold levels, the output stage is switched to the appropriate state. The built-in hysteresis eliminates oscillation and provides switching behavior of output without bouncing.

Magnetic offset caused by mechanical stress is compensated by using the chopping offset compensation technique. A series resistor or diode on the supply line is not required thanks to the built-in reverse voltage protection.

The open drain output is forced to a safe, high-impedance state (tri-state), in any of the following fault conditions: overtemperature, and undervoltage. In addition, the output current is limited (short-circuit protection).

The device is able to withstand a maximum supply voltage of 28 V for unlimited time and features overvoltage capability (40V load dump). The architecture block diagram is shown in the following Fig.

Application Circuits

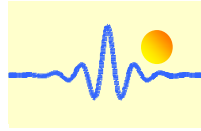

Circuit 1

Circuit 2

For applications with disturbances on the supply line or radiated disturbances, a series resistor R_V and two capacitors C_P and C_L , all placed close to the sensor, are recommended.

For example:
 $R_V = 100\Omega$
 $C_P = 4.7 \text{ nF}$
 $C_L = 1 \text{ nF}$
 $R_L = 1\text{k} \sim 10\text{k} \Omega$

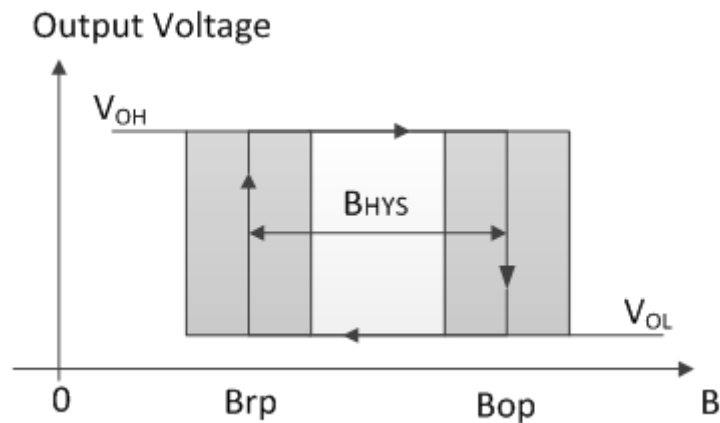

Application Example

A positive magnetic field is defined as a South Pole near to the marked side of the TO92S package. For the SOT23 package the positive magnetic field is defined as a North Pole near to the marked side.

Output is low at a small sensing distance between magnet and sensor, for case a) and c)
Output is high at a large sensing distance between magnet and sensor, for case b) and d)

Output behavior of CYD507

ESD Test

The output pin has to be in tri-state (high impedance) for ESD measurements

Symbol	Parameter	Min	Max	Unit
V_{HBM}	Human body model (according to AEC Q100-002)	-12	12	kV
