## 8. Connection

## 9. Application Notes

The Hall voltage  $V_H$  can be positive and negative. But if one connects the sensor as follows:

- Pin 1: positive input voltage  $V_+$ , for instance +5VDC.
- Pin 2: GND
- Pin 3: OUTPUT
- Pin 4: GND

One can only measure the positive voltage at the pin 3. This means that the output voltage at zero magnetic field is not zero. This voltage is called as offset voltage. The output voltage in this case is not equal to the Hall voltage. The output voltage is equal to the sum of offset voltage and Hall voltage.
